

VNA-SB-039 | Orphaned Oracle Stack Rescue (Discoverer, Workflow & EBS CEMLI) | Oracle EBS R12 CEMLI & CUSTOM.pll Offload | Redwood Clay

Oracle EBS R12 CUSTOM.pll & XX_ Schema Offload to Clean-Core APEX Sidecar Extensions

Transition from 500+ Invasive EBS R12 CEMLIs, CUSTOM.pll Triggers, Custom .fmb Forms & XX_ Schemas to Clean-Core Oracle EBS / Fusion ERP + Decoupled APEX 24.2 Sidecar Extensions on Autonomous DB with automated binary/AST metadata profiling, deterministic cost-control levers, auto-generated BRD and test documentation, and a fixed-fee 4-phase delivery roadmap.

Search Queries & Scope Covered: oracle ebs r12 cemli offload to apex | replace ebs custom.pll forms personalization | migrate xx_ custom schema to oracle apex | clean core erp sidecar extension

SOURCE LEGACY STACK (STACK X)		MODERNIZED TARGET ARCHITECTURE (STACK Y)	
500+ Invasive EBS R12 CEMLIs, CUSTOM.pll Triggers, Custom .fmb Forms & XX_ Schemas		Clean-Core Oracle EBS / Fusion ERP + Decoupled APEX 24.2 Sidecar Extensions on Autonomous DB	
CORE ERP BLOAT CUT 65% - 80%	EBS PATCH FRICTION Eliminated	SSO CONTEXT CONTINUITY Seamless	UPGRADE READINESS Accelerated

1. Problem Space & Architectural Bottlenecks

- Critical business operations remain trapped in 500+ Invasive EBS R12 CEMLIs, CUSTOM.pll Triggers, Custom .fmb Forms & XX_ Schemas, creating audit risk, manual reconciliation overhead, and rising support costs.
- Duplicate queries, cloned reports, and undocumented triggers make impact analysis slow and expensive across custom xx_ tables, views & pl/sql packages.
- Lack of automated binary-to-database metadata mapping causes traditional consulting shops to pad estimates with 40% manual discovery buffers.
- Leadership needs a predictable, fixed-fee phased timeline with verifiable test specifications and zero-downtime cutover guarantees.

2. Technical Solution & Reference Architecture

- 2.1 Automated Phase 0 AST & binary scan mapping 500+ Invasive EBS R12 CEMLIs, CUSTOM.pll Triggers, Custom .fmb Forms & XX_ Schemas artifacts directly to live Oracle dictionary metadata and profiling production data.
- 2.2 Target architecture built on Clean-Core Oracle EBS / Fusion ERP + Decoupled APEX 24.2 Sidecar Extensions on Autonomous DB, consolidating cloned queries into governed core SQL views with runtime Smart Filters.
- 2.3 Automated generation of full Business Requirements Documents (BRD), Technical Approach Docs, Testing Specifications, and Verified Test Results.
- 2.4 Zero-trust SSO/MFA (Entra ID / Okta) paired with database-enforced row-level security (VPD / RAS) and SQLcl Liquibase CI/CD pipelines.

3. Artifact-by-Artifact Conversion & Modernization Matrix

Legacy Artifact / Baseline Workload	Modernized Oracle / Cloud Target	Engineering Method & Outcome
Source Tier: 500+ Invasive EBS R12 CEMLI, CUSTOM.pll Triggers, Custom .fmb Forms & XX_ Schemas	Clean-Core Oracle EBS / Fusion ERP + Decoupled APEX 24.2 Sidecar Extensions on Autonomous DB	Automated AST & Metadata Uplift (85%-95%)
Primary Footprint: Custom EBS CEMLI Objects (Forms / CUSTOM.pll)	Oracle APEX 24.2 Redwood UI + PL/SQL APIs	Binary-to-DB Metadata Mapping + Pilot Sprint
Workload & Queries: Custom XX_ Tables, Views & PL/SQL Packages	Canonical Core SQL Views + Runtime Smart Filters	Query Fan-Out Clustering (75%-90% Reduction)
Undocumented Legacy Business Rules & QA	Auto-Generated BRD, Approach Doc, Test Specs & Results	100% Automated Documentation & utPLSQL / Playwright

4. Oracle APEX & Ancillary Engineering Toolchain

- Oracle APEX 24.2 & Universal Theme (Redwood Light Flavors)
- Oracle Database 23ai / Autonomous Database (ATP / ADW)
- Viscosity Automated Binary (.fmb/.rdf) & AST Metadata Profiler
- Auto-Doc Engine (BRD, Approach Doc, Test Specs & Test Results)
- Oracle REST Data Services (ORDS) & APEX Office Print (AOP)
- SQLcl Liquibase CI/CD, utPLSQL & Playwright Regression Suites

Anonymized Production Proof: Extracted 180 invasive EBS R12 custom Forms, CUSTOM.pll extensions, and XX_ bolt-on tables into a decoupled Oracle APEX sidecar on Autonomous Database, cutting quarterly EBS patching regression testing from 6 weeks to 4 days.

5. Principal Architect Q&A

Q: What are the primary levers that control the cost of EBS R12 CEMLI Offload to Clean-Core APEX?

A: Cost is controlled by five levers: (1) collapsing cloned query fan-out across custom xx_ tables, views & pl/sql packages into canonical core SQL views, (2) percentage of business logic already in database packages vs. UI triggers, (3) production data quality profiled during Phase 0, (4) external integration/SSO count, and (5) cutover downtime requirements.

Q: How does your tool convert binaries (.fmb, .rdf, etc.), map database metadata, and generate documentation?

A: Our automated analyzer parses legacy binaries and source files, extracts every trigger, query, and UI control, cross-references them against live database dictionary metadata (ALL_TAB_COLUMNS, ALL_DEPENDENCIES), profiles actual column data distributions, and automatically generates the Business Requirements Document (BRD), Technical Approach Doc, Test Specifications, and Verified Test Results.

Q: What does a typical project timeline look like from kickoff to production cutover?

A: Projects follow four gated phases: Phase 0 (Weeks 1-2: Binary AST Scan, Data Profiling & Auto-Generated BRD), Phase 1 (Weeks 3-6: Core Schema Uplift & Working Pilot), Phase 2 (Weeks 7-12: Automated Conversion Sprints & Test Spec Execution), and Phase 3 (Weeks 13-16: Parallel Run, Zero-Downtime Cutover & 30-Day Hypercare).
